The island of Mallorca (Balearic Islands) has a great number of archaeological sites mainly belonging to the Talaiotic and Pretalaiotic cultures that were developed in that territory before the roman conquest in 123 bC. In the same way there are located some other historical Roman, Byzantine and Islamic sites.

All this patrimony is not yet digitalized neither referenced to be used with scientific or management purposes.

In the present essay are described the stages of approaching, designing and management of GIS that is currently in use in the department of the local administration to which belongs this kind of patrimony. Emphasizing the solution of the specific questions that raise the insular space and the kind of catalogued remaining.
